Abstract: (Elsevier)
We investigate the CP-odd Higgs boson production via two-photon processes in eγ collisions. The CP-odd Higgs boson, which we denote as A0 , is expected to appear in the Two-Higgs Doublet Models (2HDM) as a minimal extension of Higgs sector for which the Minimal Supersymmetric Standard Model (MSSM) is a special case. The scattering amplitude for eγ→eA0 is evaluated at the electroweak one-loop level. The dominant contribution comes from top-quark loops when A0 boson is rather light and tanβ is not large. There are no contributions from the W -boson and Z -boson loops nor the scalar top-quark (stop) loops. The differential cross section for the A0 production is analyzed.

Note: PDFLatex, elsarticle.cls used, 5 pages, 7 PDF figures. Revised arguments in sections 2 and 3. Added one figure and references.Results unchanged

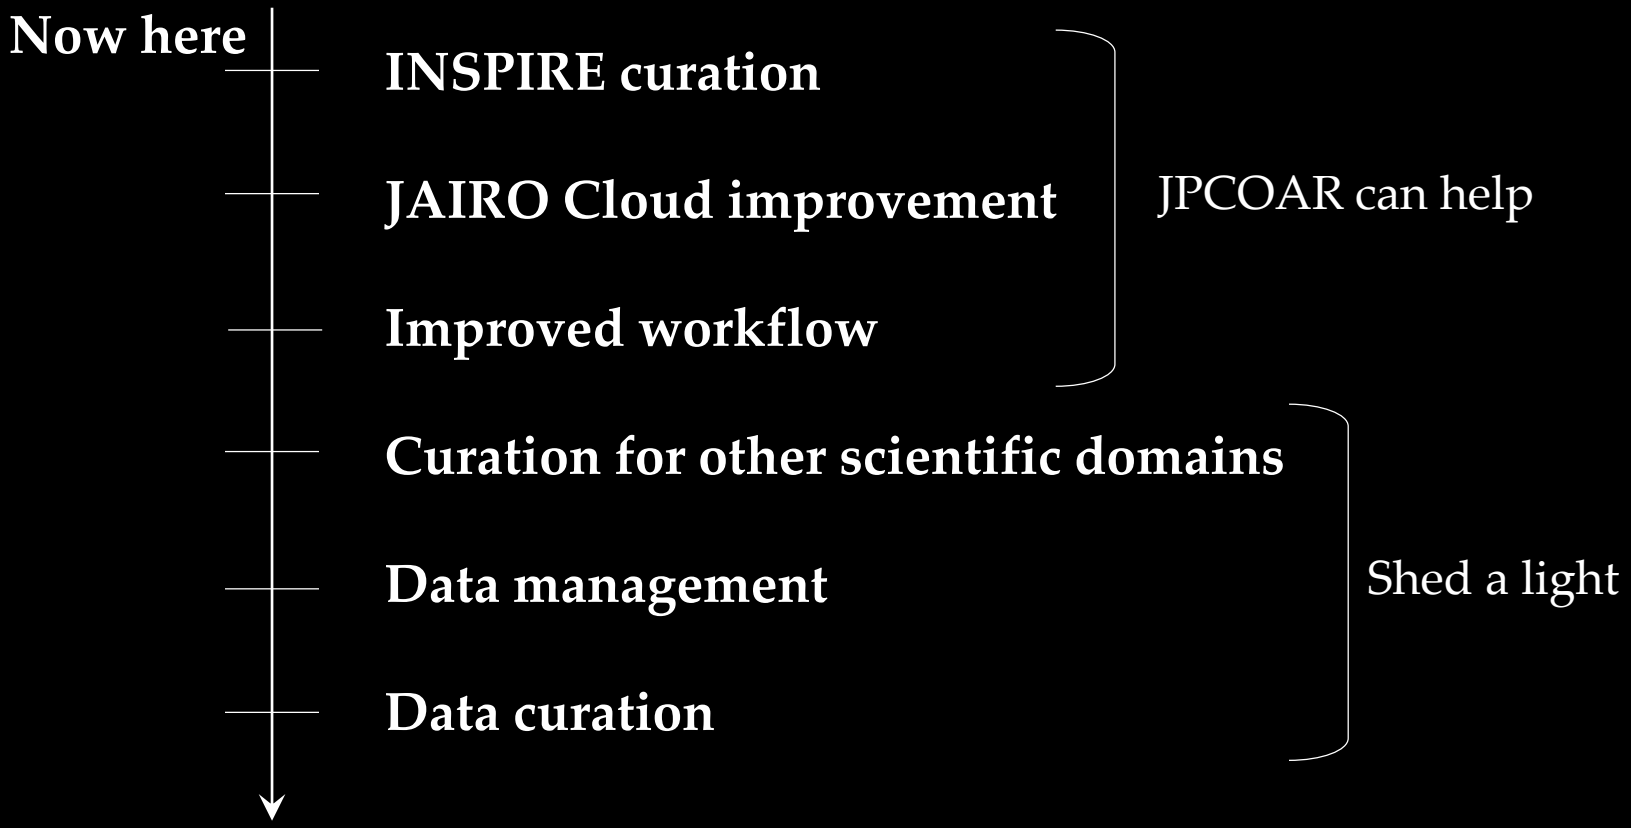
Looking at Future

Positive Side Effects (Future Application)



Curators = Librarians

We can accelerate science!

Last but not least, I am grateful to NII, CERN, and all of those involved to make this visit happen.

At the same time, it is of my great responsibility to make this opportunity the first step of a ladder for a future collaboration between NII and CERN, altogether for accelerating science.

Thank you for your attention.
