Plan of this lecture

1. Introduction

Berry phase

Haldane problem in 1D antiferromagnet

2. Topological Hall effects

Quantum Hall effect, Anomalous Hall effect

Spin Hall effect, Hall effect of light

Magnon Hall effect

3. Topological materials

Topological insulators

Topological superconductors

Topological periodic table

4. Physics of non-collinear spin structures

Multiferroics

Spin textures

Skyrmions

Why topology matters ?

1. Gauge structure of electrons in solids

electron wavefunction is often "constrained" in sub-Hilbert space \rightarrow connection and curvature

2. Two sources of "conservation law"

symmetry is related to conservation - Noether
topological index and quantum protectorate

Symmetry v.s. Topology

Rotational symmetry

Noether's theorem

Conservation of L_z

Winding number N_w

Connectivity of the loop

Conservation of N_w

Wave-packet formalism in systems with Kramers degeneracy

Let us extend the wave-packet formalism to the case with time-reversal symmetry.

Adiabatic transport

= The wave-packet stays in the same band, but can transform inside the Kramers degeneracy.

$$|\psi_n(t)\rangle = \int d^3q \left(a_1(\vec{q}, t) |\psi_{n1}(\vec{q}, \vec{x}_c, t)\rangle + a_2(\vec{q}, t) |\psi_{n2}(\vec{q}, \vec{x}_c, t)\rangle \right) \quad (n = H, L)$$

$$\begin{pmatrix} z_1(\vec{q}, t) \\ z_2(\vec{q}, t) \end{pmatrix} = \frac{1}{\sqrt{a_1^2 + a_2^2}} \begin{pmatrix} a_1(\vec{q}, t) \\ a_2(\vec{q}, t) \end{pmatrix}$$

Eq. of motion

$$\begin{cases} \dot{\vec{k}} = -e\vec{E} \\ \dot{x}_i = \frac{\partial E^n}{\partial k_i} - \dot{\vec{k}}_j (z^\dagger F_{ij}^n z) \quad n = H, L \\ \dot{z} = i(\dot{\vec{k}} \cdot \vec{A}^n) z \end{cases}$$

Real-space trajectory within Abelian approximation

Eq. of motion: $\dot{k}_i = -E_i$, $\dot{x}_i = \frac{k_i}{m_\lambda} + \frac{\lambda}{k^3} \varepsilon_{ijk} \dot{k}_j k_k$

It can be integrated:

$$\vec{k}(t) = (k_{x0}, k_{y0}, k_{z0} - E_z t),$$

$$z(t) = z_0 + \frac{k_{z0}}{m_\lambda} t - \frac{E_z}{2m_\lambda} t^2,$$

$$x(t) = x_0 + \frac{k_{x0}}{m_\lambda} t + \frac{\lambda k_{y0}}{k_{x0}^2 + k_{y0}^2} \frac{E_z t - k_{z0}}{\sqrt{k_{x0}^2 + k_{y0}^2 + (E_z t - k_{z0})^2}},$$

$$y(t) = y_0 + \frac{k_{y0}}{m_\lambda} t - \frac{\lambda k_{x0}}{k_{x0}^2 + k_{y0}^2} \frac{E_z t - k_{z0}}{\sqrt{k_{x0}^2 + k_{y0}^2 + (E_z t - k_{z0})^2}}$$

Side jump ($\perp \vec{k}$ ($\parallel \vec{S}$))

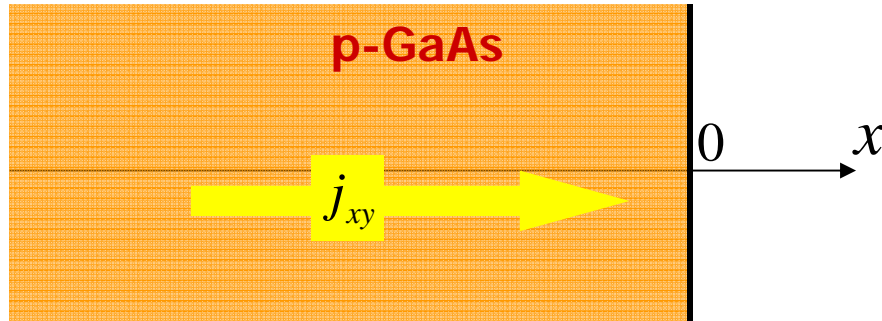

Spin motion can be known from orbital motion since $\vec{S} = \lambda \hat{k}$.

Spin current (spin//y, velocity//x)

$$j_{xy}^H = \frac{1}{3} \sum_{\lambda=\pm\frac{3}{2}, \vec{k}} \dot{x} S_y n^\lambda(\vec{k}) = \frac{E_z k_F^H}{4\pi^2 \hbar},$$

$$j_{xy}^L = \frac{1}{3} \sum_{\lambda=\pm\frac{1}{2}, \vec{k}} \dot{x} S_y n^\lambda(\vec{k}) = \frac{E_z k_F^L}{36\pi^2 \hbar},$$

Conclusions

- Emergent electromagnetism

1. Projection onto Hilbert sub-space
 - Berry phase and gauge field
 - spin-orbit, spin current physics,
3 sources of U(1) e.m.f.
2. Various Hall effects driven by
Berry curvature
3. Global topological structures Topological materials
edge/surface physics electron fractionalization
